Document 5: JP, 62-099531, A

For the "lock means for forcing a valve body to move to a first position and holding the valve body in the first position" described in claim 1, the valve body can be forced to move to either the first position or the second position by operating an "activation grip portion 7" in the valve described in document 1 cited in the ISR, and providing the "lock means" for locking the valve body to any of the positions is described as the "lock member 10" in document 2, as the "auxiliary operation button 28" and "auxiliary operation handle 30" in document 3, and as the "dial 17" in document 4. A person skilled in the art could have easily provided the lock means of documents 2, 3 and 4 in the valve of document 1.

Activating the valve body by three members: a "first temperature sensing element", a "second temperature sensing element" and a "bias spring" as described in claim 3 is described as a configuration related to a "spring 6", a "low-temperature drive element 7" and a "high-temperature drive element 8" in document 5, and a person skilled in the art could have easily changed the valve of document 1 to have the activation form described in document 5.

The configuration related to the "lock means" described in claim 4 or the "wax thermo element" described in claim 6 is a well-known technique, and using the well-known technique does not appear to involve an inventive step.
